

UML Changes

- (1) A termination variable was required in order to determine when to terminate the program.
- (2) Refactored InventoryController to the Business Layer.
- (3) String 'name' field added – a unique identifier was needed during implementation.
- (4) DateTime -> Calendar - Date is now deprecated.
- (5) ItemSale and CategorySale 'Extends' arrows re-added that were deleted by accident before submitting the UML.
- (6) 'location' field changed from String to Location to more easily define and perceive the appropriate section to record the defect to (i.e., storage or shelves).
- (7) supplyTime: int field removed – field is irrelevant in this module.
- (8) Added simple objects to complement the use of ResponseT<T>.
